

Chapter 4: Network Access

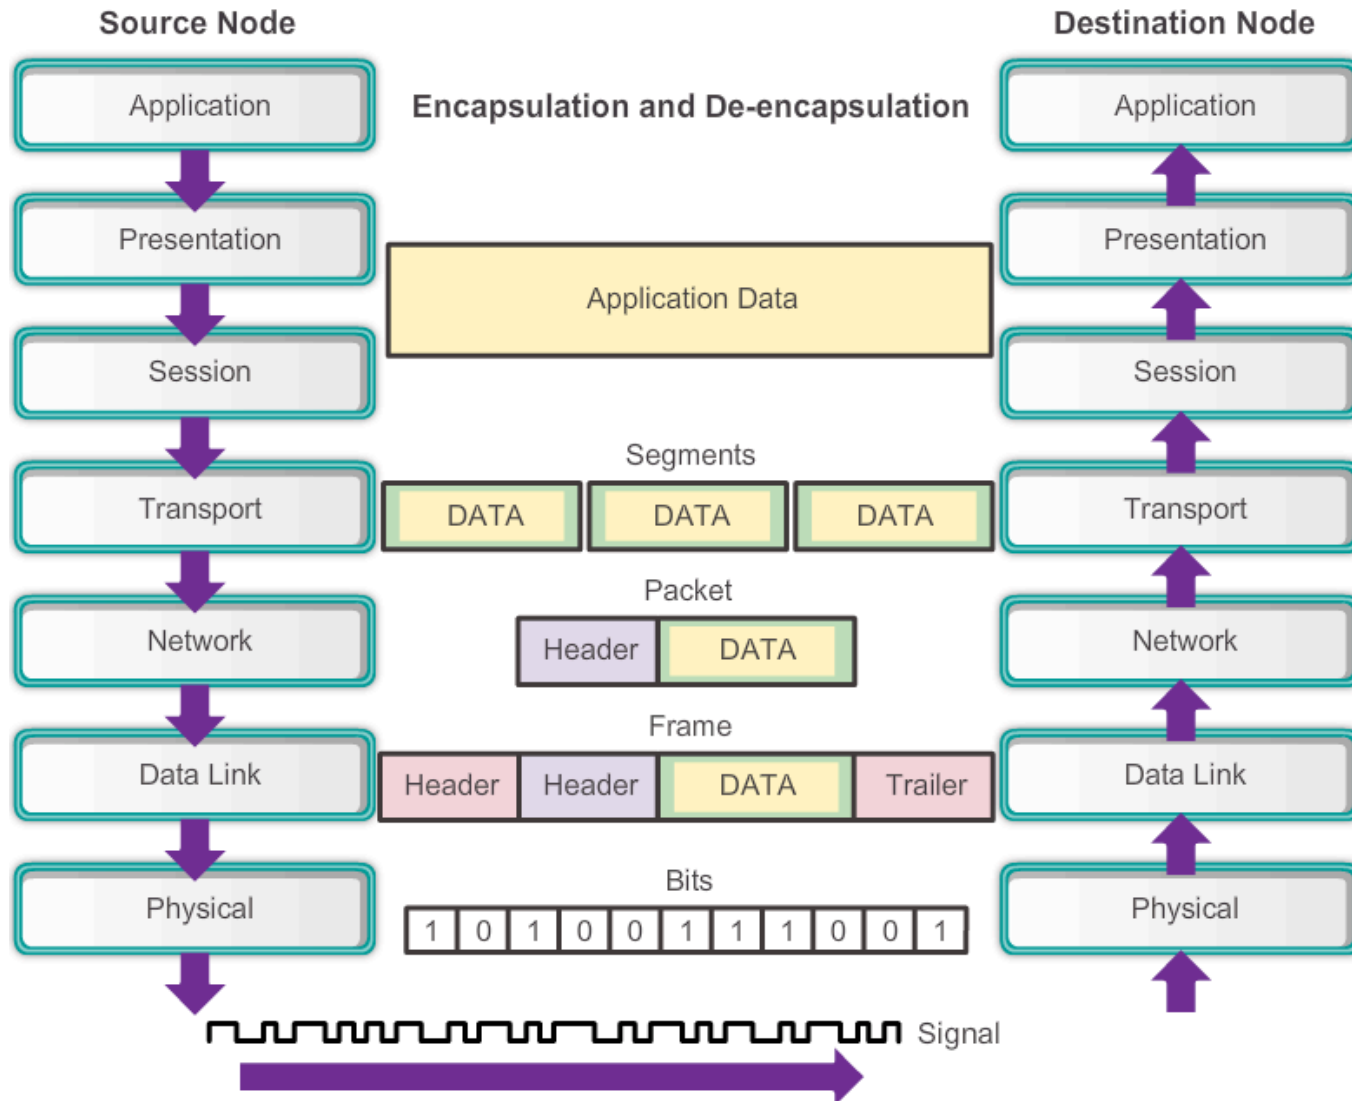

Introduction to Networks

Cisco | Networking Academy®
Mind Wide Open™

Purpose of the Physical Layer

The Physical Layer

Purpose of the Physical Layer

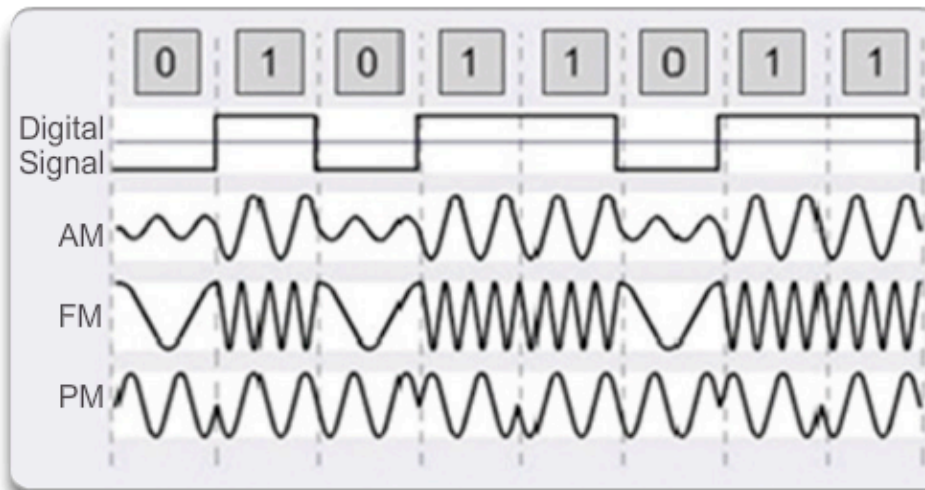

Physical Layer Media

Electrical Signals -
Copper cable

Light Pulse -
Fiber-optic cable

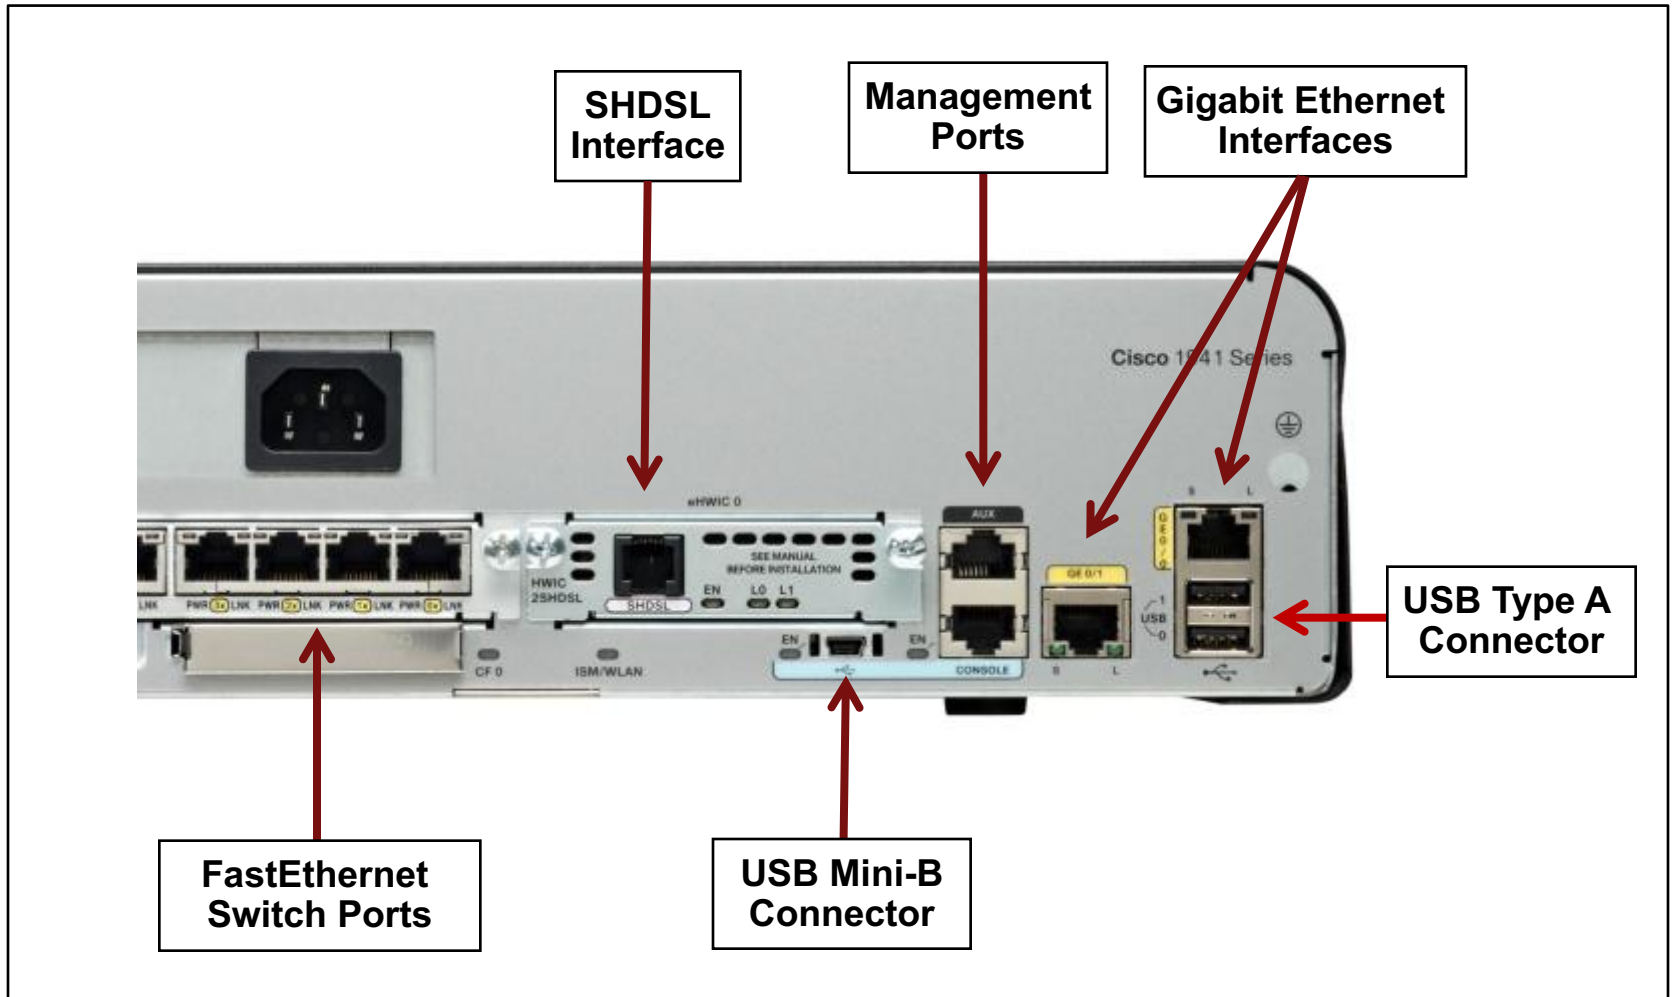

Microwave Signals -
Wireless

Fundamental Principles of Layer 1

Types of Physical Media

Copper Cabling

Copper Media

Unshielded Twisted
Pair (UTP) Cable

Shielded Twisted
Pair (STP) Cable

Coaxial Cable

Copper Cabling

UTP Cable

Copper Cabling

STP Cable

Copper Cabling

Coaxial Cable

UTP Cabling

Properties of UTP Cabling

UTP cable does not use shielding to counter the effects of EMI and RFI. Instead, cable designers have discovered that they can limit the negative effect of crosstalk by:

- Cancellation
- Varying the number of twists per wire pair

UTP Cabling

UTP Cabling Standards

Category 3 Cable
(UTP)

Category 7 Cable
(ScTP)

Category 6 Cable
(UTP)

Category 5 and 5e
Cable (UTP)

Category 5 and 5e Cable (UTP)

- Used for Data transmission
- Cat 5 supports 100 Mbps and can support 1000 Mbps but it is not recommended
- Cat 5e supports 1000 Mbps

UTP Cabling

Types of UTP Cable

| Cable Type | Standard | Application |
|---------------------------|------------------------------------|---|
| Ethernet Straight-through | Both ends T568A or both ends T568B | Connects a network host to a network device such as a switch or hub. |
| Ethernet Crossover | One end T568A, other end T568B | <ul style="list-style-type: none"> Connects two network hosts Connects two network intermediary devices (switch to switch, or router to router) |
| Rollover | Cisco proprietary | Connects a workstation serial port to a router console port, using an adapter. |

Fiber Optic Cabling

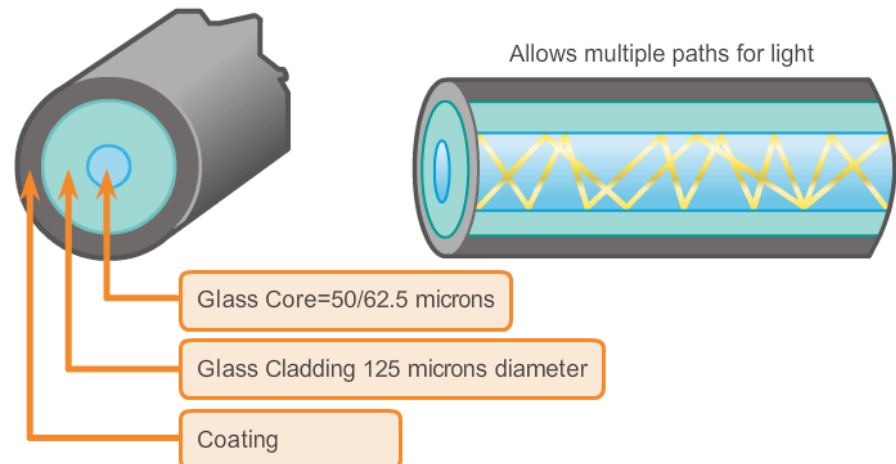

Types of Fiber Media

Single Mode

- Small core
- Less dispersion
- Suited for long distance applications
- Uses lasers as the light source
- Commonly used with campus backbones for distances of several thousand meters

Multimode

- Larger core than single mode cable
- Allows greater dispersion and therefore, loss of signal
- Suited for long distance applications, but shorter than single mode
- Uses LEDs as the light source
- Commonly used with LANs or distances of a couple hundred meters within a campus network

Fiber Optic Cabling

Network Fiber Connectors

ST Connectors

SC Connectors

LC Connector

Duplex Multimode LC Connectors

Wireless Media

802.11 Wi-Fi Standards

| Standard | Maximum Speed | Frequency | Backwards Compatible |
|----------|-------------------------|---------------------------|----------------------|
| 802.11a | 54 Mbps | 5 GHz | No |
| 802.11b | 11 Mbps | 2.4 GHz | No |
| 802.11g | 54 Mbps | 2.4 GHz | 802.11b |
| 802.11n | 600 Mbps | 2.4 GHz or 5 GHz | 802.11b/g |
| 802.11ac | 1.3 Gbps (1300 Mbps) | 2.4 GHz and 5.5 GHz | 802.11b/g/n |
| 802.11ad | 7 Gbps (7000 Mbps) | 2.4 GHz, 5 GHz and 60 GHz | 802.11b/g/n/ac |

Purpose of the Data Link Layer

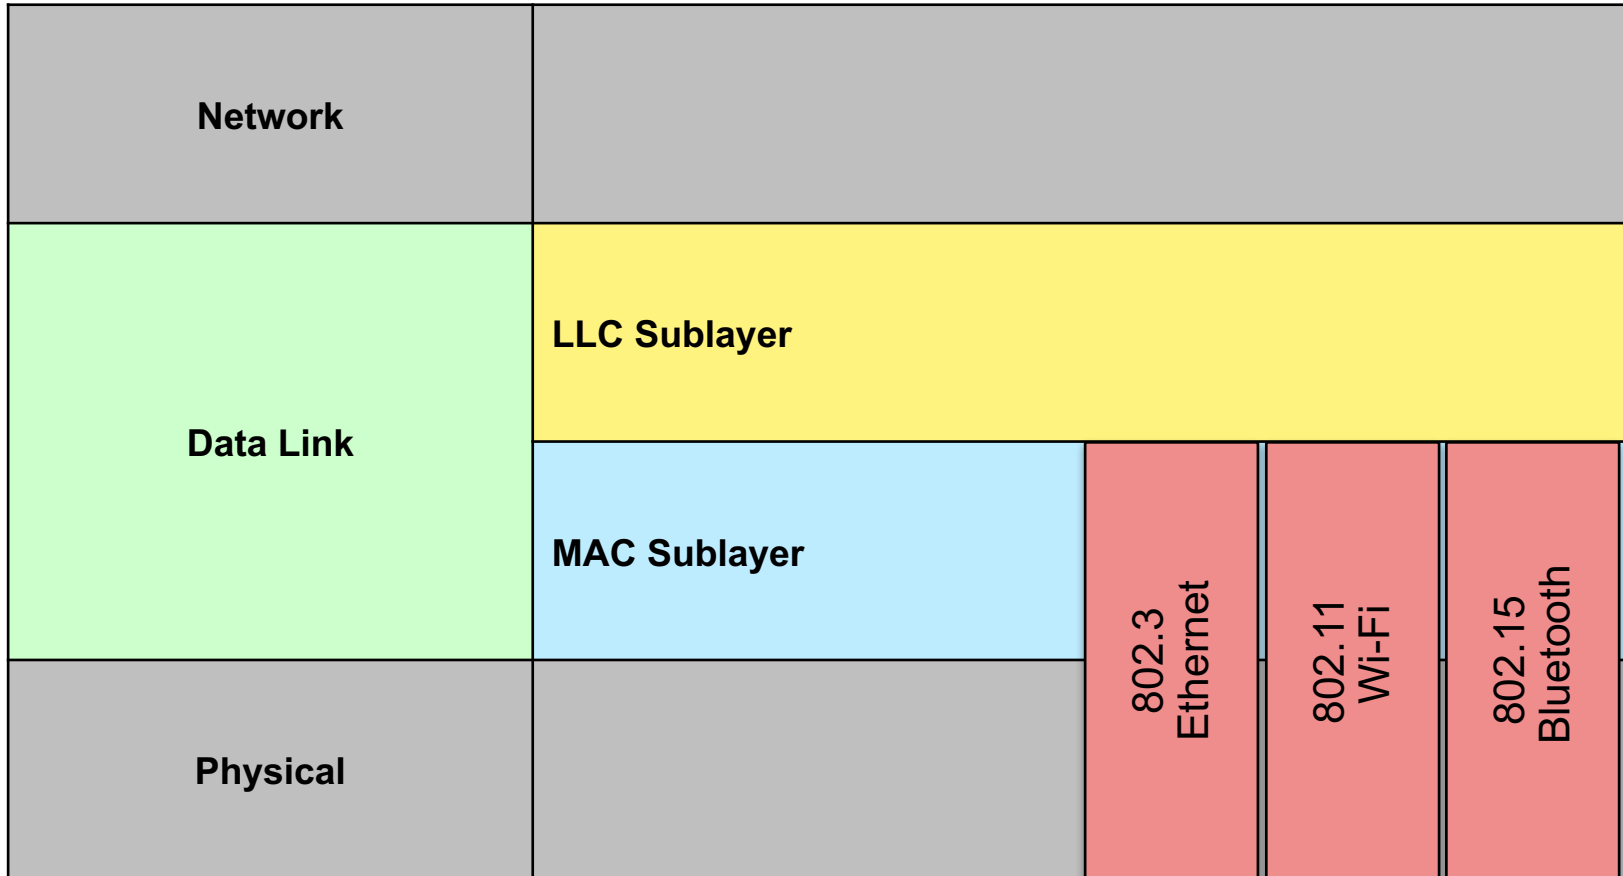

The Data Link Layer

Purpose of the Data Link Layer

Data Link Sublayers

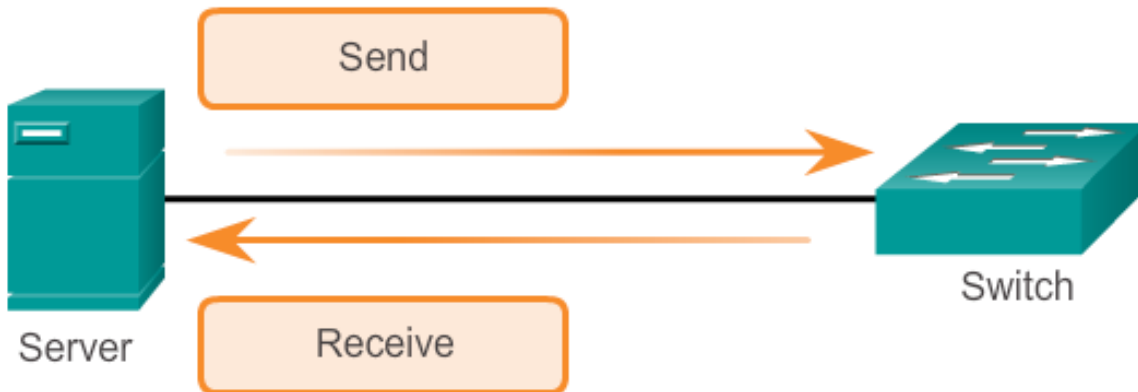

WAN Topologies

Half- and Full-Duplex

Half-Duplex

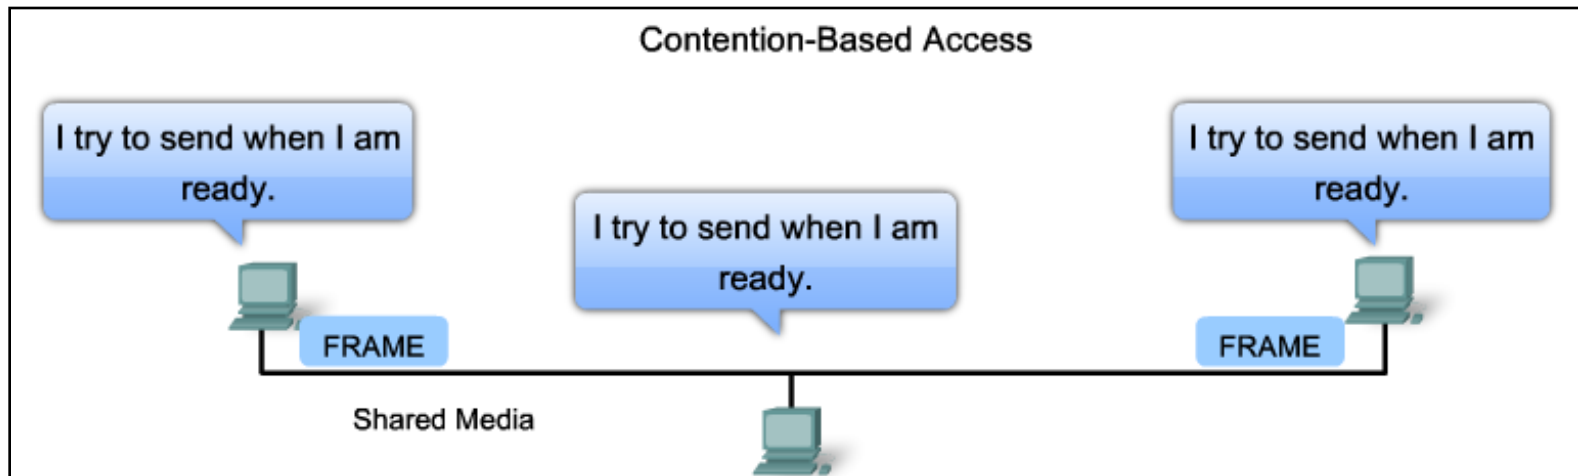

Full-Duplex

LAN Topologies

Contention-Based Access

Characteristics

- Stations can transmit at any time
- Collision exist
- There are mechanisms to resolve contention for the media

Contention-Based Technologies

- CSMA/CD for 802.3 Ethernet networks
- CSMA/CA for 802.11 wireless networks

Data Link Frame

Ethernet Frame

Ethernet Protocol

A Common Data Link Layer Protocol for LANs

| Frame | | | | | | |
|------------|----------|-------------|---------|---------|-----------------|----------------------|
| Field name | Preamble | Destination | Source | Type | Data | Frame Check Sequence |
| Size | 8 bytes | 6 bytes | 6 bytes | 2 bytes | 46 - 1500 bytes | 4 bytes |

Preamble - Used for synchronization; also contains a delimiter to mark the end of the timing information

Destination Address - 48-bit MAC address for the destination node

Source Address - 48-bit MAC address for the source node

Type - Value to indicate which upper layer protocol will receive the data after the Ethernet process is complete

Data or payload - This is the PDU, typically an IPv4 packet, that is to be transported over the media.

Frame Check Sequence (FCS) - A value used to check for damaged frames

Data Link Frame

Point-to-Point Protocol Frame

Point-to-Point Protocol

A Common Data Link Protocol for WANs

| Frame | | | | | | |
|------------|--------|---------|---------|----------|----------|--------------|
| Field name | Flag | Address | Control | Protocol | Data | FCS |
| Size | 1 byte | 1 byte | 1 byte | 2 bytes | variable | 2 or 4 bytes |

Flag - A single byte that indicates the beginning or end of a frame. The flag field consists of the binary sequence 01111110.

Address - A single byte that contains the standard PPP broadcast address. PPP does not assign individual station addresses.

Control - A single byte that contains the binary sequence 00000011, which calls for transmission of user data in an unsequenced frame.

Protocol - Two bytes that identify the protocol encapsulated in the data field of the frame. The most up-to-date values of the protocol field are specified in the most recent Assigned Numbers Request For Comments (RFC).

Data - Zero or more bytes that contain the datagram for the protocol specified in the protocol field.

Frame Check Sequence (FCS) - Normally 16 bits (2 bytes). By prior agreement, consenting PPP implementations can use a 32-bit (4-byte) FCS for improved error detection.
